

[GWA] MRR SalesPage Hints & Tips

Your new plugin package includes everything you need to recreate and link the original sales page on your blog or integrate a custom sales page of your own.

Here are some tips to get the most from your new plugin:

- 1) To customize the integrated sales page do NOT use the HTML Editor in WP. Copy the HTML Source to your Preferred HTML Editor on your PC for editing. Paste the updated HTML sales page back into the Source window to save it.
- 2) You will receive an email directly from Paypal after a product payment & sale. Check the sales records in wp-admin for a sale with matching transaction_id.

If you cannot find the transaction/sales record the IPN was not received.

Send the product link to your client as soon as possible manually as they did not receive a link automatically by email. If this happens often check your Paypal account type. To use IPN you must have a "business account" type.

- 3) Integrated page may display improperly on your blog due to style/css conflict. Fix the formatting in your own HTML Editor - use on page tags & override css.
- 4) When updating integrated sales page and inserting images always use the complete url in the src="..." tag (not a relative ../url).
- 5) You can hide pages from the dynamic menu widget by including the page_id number in the menu widget "exclude" field. Note: Useful if you use an original salespage only as you **MUST HAVE a page with the [shortcode]** as a forward/pickup page after purchase.
- 6) To secure your product download use `.htaccess` controls on the `dl_files` dir. Provide login info to clients in Thank You email. Change credentials often.
- 7) If you choose not to use the `dl_files` dir please substitute a document at the download link that provides clients with further instruction. This link is added automatically to all Thank You email messages.
- 8) Check the website at <http://OgBlog.biz> for further hints, tips, and updates.
